CAM-MIPI7251RAW Quick Start

Date	Revision
2022-10-27	Correct Chapter 2.3 Mode Description
2022-11-23	Add method about install header files Correct Folder description

1,Key Specifications:

1,Active array size: 640x480 ,**Global Shutter,External Trigger.**
2,Output formats: 8bit RAW BW and 10 bit RAW BW.
3,Frame rate: 158fps.
4,Optical coupled isolated external trigger input and flash output support
5,Support 4 work mode:

- **0, 10 bit stream mode**
- **1, 8 bit stream mode**
- **2, 10 bit external trigger mode**
- **3, 8 bit external trigger mode**

Work on 8bit stream mode by default.
6, Software trigger input support.
7, driver feature support : gain,exposure,hflip,vflip
8, Provide GPL Linux 5.15.32 driver source code.

Hardware Description:

Default Len

- Interface: M12
- Field of view Fov(D) = 148 degrees , Fov(H) = 118 degrees
- Focal Length 2.8 mm
- Focal Distance Adjustable
- TV DISTORTION <-17%
- F(N) /Aperture 2.2

Signal/Power Connector J1

STROB Connector J2

J2 PIN	Symbol
1	STROB+
2	STROB-

Reference Circuit

On-board TLP281 optocoupler isolation, Notice the max collector current is 50mA.

Output Specifications

S. No	Parameter	Test Condition	Value			Unit
			Min	Typ	Max	
1	Driver Voltage (VCC)			12	24	V
2	Drive current (Icc)			10	50	mA
3	Collector Emitter Breakdown Voltage				80	V
4	Collector Emitter Saturation Voltage	Icc = 1 mA		0.1	0.2	V
5	Power Dissipation				150	mW

Collector-Emitter Saturation Voltage	$V_{CE(sat)}$	I_F = 10mA, I_C = 1mA		0.1	0.2	V

So If the current required to drive the Flash LED is no more than 50mA
The value of series resistor: R1 = (VCC- Vf - VCE) / If
VCC: system Voltage
Vf: Forward voltage of Flash LED for current Icc
VCE: Collection Emitter voltage, typical:0.1V
If the current required to drive the flash exceeds 50mA, then it is required to drive it with the help of LED driver circuit, and LED driver circuit can be controlled by using the strobe output pin.

EXT TRIG Connector J3

J3 PIN	Symbol	Description
1	TRIG+	3.3V-5.0V External Trigger Input
2	TRIG-	External GND

Reference Circuit

For example, VCC = 12V, Vf = 1.25V

The calculations done here are based on 12VDC. Please do follow these calculations for other voltages like 24VDC.

Let's take the current through IR LED I_f = 20mA.
Voltage drop across the IR LED = 1.25V
The value of Resistor $R_1 = (V_{cc}-V_f)/I_f = (12 – 1.25)/0.02 = 537.5\ \Omega$
Wattage of resistor $R_1 > I_f^2 * R_1 = 0.02^2*537.5 = 0.215W$
Wattage of the resistor R_1 selected should be greater than 0.215W.

And there is a resistor on board(R4 = 200 Ω), So the R_add = R1 - R4 = 537.5 - 200 = 337.5 Ω

2,Install Driver:

2.1 Compile Driver Source Code

Step1 ,Download Source Code from our github:

```
$sudo git clone https://github.com/INNO-MAKER/cam-mipiov7251-trigger.git
```

Step2 ,Install the linux kernel header :

If you are using the latest version of Raspbian, Install the Linux kernel headers via below command.

```
$sudo apt-get install raspberrypi-kernel-headers
```

Remark:

If you are use the older version of Raspbian or unable to locate package, manually download the correct headers files from below link. We take kernel 5.15.32-v8+(64bit,released data 2020-0404) as an example.

https://archive.raspberrypi.org/debian/pool/main/r/raspberrypi-firmware/

raspberrypi-kernel-headers_1.20220331-1_amd64.deb	2022-04-04 12:55	37M
raspberrypi-kernel-headers_1.20220331-1_arm64.deb	2022-04-04 12:55	9.2M
raspberrypi-kernel-headers_1.20220331-1_armhf.deb	2022-04-04 12:56	27M

Use dpkg tools installl the headers deb files via below command.

```
$sudo dpkg -i raspberry-kernel-headers_1,20220331-1_arm64.deb
```

Step3,Compile the driver source code

```
$cd cam-mipiov7251-trigger
$sudo tar -xvf inno_mipi_ov7251_driver_pi_lattice_linux5.15.tar.gz
$sudo chmod -R a+rwx *
$cd inno_mipi_ov7251_driver_pi_lattice_linux5.15
$sudo make
```

Step4,Install the innomaker driver

```
$sudo make install     #Work on 8bit stream mode by default.
```

2.2 Enable Camera

Step1, edit /boot/config.txt

```
$sudo nano /boot/config.txt
```

Step2, Add below content to the last line and reboot

```
dtoverlay=inno_mipi_ov7251
```

Step3, Reboot

```
$sudo reboot
```

***** Remark1 If USE CM4**

```
dtoverlay=inno_mipi_ov7251_cm4_dual
```

***** Remark2 If USE pi zero(bcm2835)**

```
dtoverlay=inno_mipi_ov7251,i2c_pins_28_29=1
```

***** Remark3 If you wish to use raspberry pi official driver :(pi driver do not support trigger mode)**

Enable the official driver by edit /boot/config.txt by add below content

```
dtoverlay=ov7251,media-controller=1
```

.

2.3 Working Mode Description:

Mode	*Description*	*array*	*Frame rate*
0	10 bit stream mode	640x480	158fps
1	8 bit stream mode	640x480	158fps
2	10 bit external trigger mode	640x480	158fps
3	8 bit external trigger mode	640x480	158fps

2.4 Working mode change:

```
$cd cam-mipiov7251-trigger/inno_mipi_ov7251_driver_pi_lattice_linux5.15
$sudo make setmodex      #   x can be 0 1 2 3
```

Get camera module work mode information:

```
$ modinfo inno_mipi_ov7251
```

3,Software Trigger:

Step1 : set camera work in external trigger mode.

For example set the module work in mode3

```
$ sudo make setmode3
```

Open /dev/video0 device in VLC

Step2: Transfer software trigger command through i2c bus

```
$ i2cset -f -y 10 0x10 204 1
```

Remark:

*** Set the sensor module back to external hardware trigger mode by:

```
$ i2cset -f -y 10 0x10 204 0
```

4,Hardware Trigger :

*** Set the sensor module back to external hardware trigger mode by:

```
$ i2cset -f -y 10 0x10 204 0
```

Wire connection

You can connect the TRIG- to the GND Pin and connect the TRIG+ to 3.3V Pin of Raspberry Pi to simulate a trigger signal. This test function will comes with repeated trigger signal sometime.

Step1 : set camera work in external trigger mode.

For example set the module work in mode3

```
$ sudo make setmode3
```

Open /dev/video0 device in VLC

Step2: Put external trigger signal through TRIG pin head.

For example a 3.3v gpio rising edge signal will trigger the frame output.

```
$cd cam-mipiov7251-trigger
$sudo ./gpio-sysfs
```
